Rencontres MEXICO, 24 et 25 novembre 2022

System & black-box model

Input parameters :

- component size
- material
- swell height
- ...

inputs

Complex system :
Floating wind turbine

output

- Cost
- energy production
- environmental impact
- ...

System & black-box model

- The x are the deterministic inputs
- The u are uncertain inputs : $u = U(\omega)$ with U a random vector of density ρ_U
- f is the objective function to minimize
- g is the constraint function defining the constraint to respect : $g \leq 0$

Optimization problem

Robust optimization problem

$$\begin{aligned} x^* &= \arg \min_x \mathbb{E}[f(x, U)] \\ \text{s.t. } \mathbb{P}[g(x, U) \leq 0] &\geq P_{\text{target}} \end{aligned} \quad (1)$$

Deterministic strategy

$$\begin{aligned} x^* &= \arg \min_x F(x) \\ \text{s.t. } G(x) &\leq 0 \end{aligned} \quad (2)$$

- Goal Oriented Sensitivity Analysis to reduce the input dimension : Spagnol 2020
- Huge evaluation cost of F and G
- What about the U ?

How to quantify the impact of the uncertain inputs U on the optimization ?

Toy function

Toy function from [El-Amri et al. 2021]

$$\forall (x, u) \in [-5, 5]^4 \quad g(x, u) = -x_1^2 + 5x_2 - u_1 + u_2^2 - 1$$

$$\Gamma_u = \{x \in [-5, 5]^2, g(x, u) \leq 0\}$$

u_2 fixé

$u_1 = -5 \quad u_2 = 0$

Toy function

Toy function from [El-Amri et al. 2021]

$$\forall (x, u) \in [-5, 5]^4 \quad g(x, u) = -x_1^2 + 5x_2 - u_1 + u_2^2 - 1$$

$$\Gamma_u = \{x \in [-5, 5]^2, g(x, u) \leq 0\}$$

u_2 fixé

$u_1 = -2.5 \quad u_2 = 0$

Toy function

Toy function from [El-Amri et al. 2021]

$$\forall (x, u) \in [-5, 5]^4 \quad g(x, u) = -x_1^2 + 5x_2 - u_1 + u_2^2 - 1$$

$$\Gamma_u = \{x \in [-5, 5]^2, g(x, u) \leq 0\}$$

u_2 fixé

$u_1 = 0 \quad u_2 = 0$

Toy function

Toy function from [El-Amri et al. 2021]

$$\Gamma_u = \{x \in [-5, 5]^2, g(x, u) \leq 0\}$$

u_1 fixé

$u_1 = 0 \quad u_2 = 5$

Subproblem : Excursion sets

Excursion sets

New output :

$$\Gamma_U = \{x \in \mathcal{X}, g(x, U) \leq 0\}, \quad (3)$$

which is called a random excursion set.

Influence of the uncertain inputs U on Γ_U ? \Rightarrow SA on excursion sets.

Yet most SA techniques have scalar or vectorial outputs.

How then can we do sensitivity analysis on (excursion) sets?

- SA on sets using random set theory notably Vorob'ev expectation and deviation
- SA on sets using universal indices from Fort, Klein et Lagnoux 2021
- **SA on sets using RKHS theory**

Distribution embedding into a RKHS

Distance between distributions as expectation of kernels, Gretton et al. 2006

$$\gamma_k^2(\mathbb{P}, \mathbb{Q}) := \|\mu_{\mathbb{P}} - \mu_{\mathbb{Q}}\|_{\mathcal{H}_k}^2 = \mathbb{E}_{\substack{X, X' \sim \mathbb{P} \\ Y, Y' \sim \mathbb{Q}}} [k(X, X') + k(Y, Y') - 2k(X, Y)]$$

→ is a distance between distribution iff k is *characteristic* (i.e. injectivity of the embedding)

MMD-based index

MMD-based index

$$\begin{aligned} S_i &:= \mathbb{E}_{X_i} [\gamma_k^2(\mathbb{P}_Y, \mathbb{P}_{Y|X_i})] \\ &= \mathbb{E}_{X_i} \mathbb{E}_{\xi \sim \mathbb{P}_{Y|X_i}} \mathbb{E}_{\xi' \sim \mathbb{P}_{Y|X_i}} [k(\xi, \xi')] - \mathbb{E}_{Y \sim \mathbb{P}_Y} \mathbb{E}_{Y' \sim \mathbb{P}_Y} [k(Y, Y')]. \end{aligned}$$

→ has a ANOVA decomposition (daVeiga 2021) : can be used to rank the inputs by influence.

Estimation

- Pick & freeze estimation
- Rank-based estimation

HSIC-based index Gretton et al. 2006

HSIC-based index

$$\begin{aligned}HSIC_k(X_i, Y) &:= \gamma_k^2(\mathbb{P}_{X_i, Y}, \mathbb{P}_{X_i} \otimes \mathbb{P}_Y) \\ &= \mathbb{E}_{X_i, X'_i, Y, Y'} k_{\mathcal{X}}(X_i, X'_i) k(Y, Y') \\ &\quad + \mathbb{E}_{X_i, X'_i} k_{\mathcal{X}}(X_i, X'_i) \mathbb{E}_{Y, Y'} k(Y, Y') \\ &\quad - 2 \mathbb{E}_{X_i, Y} [\mathbb{E}_{X'_i} k_{\mathcal{X}}(X_i, X'_i) \mathbb{E}_{Y'} k(Y, Y')]\end{aligned}$$

with (X'_i, Y') an independent copy of (X_i, Y) .

$HSIC_k(X_i, Y) = 0$ iff $X_i \perp Y$ (when k characteristic) \rightarrow suited to identify the negligible inputs through independence testing.

Estimation

- Biased or unbiased classic estimators of $HSIC_k(X_i, Y)$
- p-values computable through asymptotic results or bootstrap methods

Table of Contents

SA on sets : a kernel between sets

Proposition (A kernel between sets, Balança et Herbin 2012)

The function $k_{\text{set}} : \mathcal{F}(\mathcal{X}) \times \mathcal{F}(\mathcal{X}) \rightarrow \mathbb{R}$ defined by

$$\forall \Gamma, \Gamma' \in \mathcal{F}(\mathcal{X}), \quad k_{\text{set}}(\Gamma, \Gamma') = \frac{\sigma^2}{2\lambda} e^{-\lambda\mu(\Gamma\Delta\Gamma')},$$

is positive definite for any positive scalars σ and λ .

Moore-Aronszajn theorem (Aronszajn (1950)) gives then the existence of a unique RKHS $\mathcal{H} \subset \mathcal{F}(\mathcal{X})^{\mathbb{R}}$ of reproducing kernel k_{set} .

Estimation with set-valued outputs

In the MMD- and HSIC-based indices expressions, we need to estimate quantities of the form $\mathbb{E}k_{\text{set}}(\Gamma_1, \Gamma_2)$.

With sets, $k_{\text{set}}(\Gamma_1, \Gamma_2)$ also require an estimation.

$$k_{\text{set}}(\Gamma_1, \Gamma_2) = e^{-\mu(\Gamma_1 \Delta \Gamma_2)} \quad (4)$$

$$= e^{-\mathbb{E}[\mathbb{1}_{\Gamma \Delta \Gamma'}(X)]} \text{ with } X \sim \mathcal{U}(\mathcal{X}) \quad (5)$$

$$\simeq e^{-\mu(\mathcal{X}) \frac{1}{N_X} \sum_{i=1}^{N_X} \mathbb{1}_{\Gamma_1 \Delta \Gamma_2}(X^i)} \quad (6)$$

$$= \widehat{k_{\text{set}}}(\Gamma_1, \Gamma_2) \quad (7)$$

Then we inject it in the indices estimators. For instance the normalized MMD-based index estimated through pick and freeze method is :

$$\widehat{S_{A,p.f}^{MMD}} = \frac{\sum_{i=1}^n \widehat{k_{\text{set}}}(\Gamma^{(i)}, \check{\Gamma}^{A,(i)}) - \widehat{k_{\text{set}}}(\Gamma^{(i)}, \Gamma'^{(i)})}{\sum_{i=1}^n \widehat{k_{\text{set}}}(\Gamma^{(i)}, \Gamma^{(i)}) - \widehat{k_{\text{set}}}(\Gamma^{(i)}, \Gamma'^{(i)})}. \quad (8)$$

Asymptotic behaviour of the indices on sets

Proposition (Quadratic error of a nested Monte Carlo estimator)

With the previous notations, using Rainforth et al. 2018, we have

$$\mathbb{E} \left(\frac{1}{n} \sum_{j=1}^n \widehat{k_{\text{set}}}(\Gamma_1^{(j)}, \Gamma_2^{(j)}) - \mathbb{E}k_{\text{set}}(\Gamma_1, \Gamma_2) \right)^2 = \mathcal{O}\left(\frac{1}{n} + \frac{1}{N_x^2}\right). \quad (9)$$

With this result, we can show that each quadratic error of our indices on sets has the same asymptotic behavior with rate $\mathcal{O}\left(\frac{1}{n} + \frac{1}{N_x^2}\right)$

Test case : oscillator, Cousin 2021

$$g_1(\mathbf{x}, \mathbf{u}) = u_{r_1} - \max_{t \in [0, T]} \mathcal{Y}'(x_1 + u_1, x_2 + u_2, u_p; t), \quad (10)$$

$$g_2(\mathbf{x}, \mathbf{u}) = u_{r_2} - \max_{t \in [0, T]} \mathcal{Y}''(x_1 + u_1, x_2 + u_2, u_p; t), \quad (11)$$

with \mathcal{Y} the solution of the harmonic oscillator defined by :

$$(x_1 + u_1)\mathcal{Y}''(t) + u_p\mathcal{Y}'(t) + (x_2 + u_2)\mathcal{Y}(t) = \eta(t). \quad (12)$$

Uncertainty	Distribution	Uncertainty	Distribution
U_1	$\mathcal{U}[-0.3, 0.3]$	U_{r_1}	$\mathcal{N}(1, 0.1^2)$
U_2	$\mathcal{U}[-1, 1]$	U_{r_2}	$\mathcal{N}(2.5, 0.25^2)$
U_p	$\mathcal{U}[0.5, 1.5]$	U_{r_3}	$\mathcal{N}(15, 3^2)$

Table – Definition of the uncertain inputs

Results on the oscillator case : MMD-based index

Figure – MMD-based total index for the constraint $g_1 \leq 0$

Results on the oscillator case : MMD-based index

Figure – MMD-based total index for the constraint $g_2 \leq 0$

Results on the oscillator case : MMD-based index

Figure – MMD-based total index for the constraint $g_1 \leq 0$ and $g_2 \leq 0$

Results on the oscillator case : MMD-based index

Figure – MMD-based total index for the couple ($g_1 \leq 0, g_2 \leq 0$)

Results on the oscillator case : HSIC-based index

Excursion sets are random sets

For K compact, $h(U) = X = \{x \in \mathcal{X}, g(x, U) \leq 0\}$

$$\{K \cap X \neq \emptyset\} =^c \{\omega, K \cap X(\omega) = \emptyset\}$$

$$=^c \{\omega, \forall x \in K \ g(x, U(\omega)) > 0\}$$

$$=^c \{\omega, \inf_{x \in K} g(x, U(\omega)) > 0\} \text{ as } K \text{ compact and } g \text{ continuous in } x$$

$$=^c U^{-1}(\inf_{x \in K} g(x, \cdot)^{-1}(]0, +\infty[)) \in \mathcal{F}$$

Indices estimation

$$S_{A,p.f}^{MMD} = \frac{\sum_{i=1}^n k_{\text{set}}(\Gamma^{(i)}, \tilde{\Gamma}^{A,(i)}) - k_{\text{set}}(\Gamma^{(i)}, \Gamma'^{(i)})}{\sum_{i=1}^n k_{\text{set}}(\Gamma^{(i)}, \Gamma^{(i)}) - k_{\text{set}}(\Gamma^{(i)}, \Gamma'^{(i)})}. \quad (13)$$

$$S_{I,\text{rank}}^{MMD} = \frac{\frac{1}{n} \sum_{i=1}^n k_{\text{set}}(\Gamma^{(i)}, \Gamma^{\sigma_n^l(i)}) - \frac{1}{n^2} \sum_{i,j=1}^n k_{\text{set}}(\Gamma^{(i)}, \Gamma^{(j)})}{\frac{1}{n} \sum_{i=1}^n k_{\text{set}}(\Gamma^{(i)}, \Gamma^{(i)}) - \frac{1}{n^2} \sum_{i,j=1}^n k_{\text{set}}(\Gamma^{(i)}, \Gamma^{(j)})}. \quad (14)$$

$$\text{HSIC}_u(U_A, \Gamma) = \frac{1}{n(n-1)} \sum_{i,j=1, i \neq j}^n \left(k_{\mathcal{U}_A}(U_A^{(i)}, U_A^{(j)}) - 1 \right) k_{\text{set}}(\Gamma^{(i)}, \Gamma^{(j)}), \quad (15)$$

$$\text{HSIC}_b(U_A, \Gamma) = \frac{1}{n^2} \sum_{i,j=1}^n \left(k_{\mathcal{U}_A}(U_A^{(i)}, U_A^{(j)}) - 1 \right) k_{\text{set}}(\Gamma^{(i)}, \Gamma^{(j)}). \quad (16)$$

Random set distribution embedding

Definition (Capacity functional)

The capacity functional of a random closed set Γ denoted T_Γ is defined by :

$$T_\Gamma : \begin{array}{l} \mathcal{K}(\mathcal{X}) \rightarrow [0, 1] \\ K \mapsto \mathbb{P}(\Gamma \cap K \neq \emptyset). \end{array} \quad (17)$$

Definition (Mean embedding of a capacity functional)

The mean embedding of T_Γ is defined as

$$\mu_\Gamma = \mathbb{E}[k_{\text{set}}(\Gamma, \cdot)]. \quad (18)$$
